

RemSolution — Application Walkthrough

What the product does, who does what in it, which screen does what, and where every setting lives.

Contents

- 1. The big picture — three layers, three kinds of user
 - 2. Role 1 — Platform Administrator
 - 3. Role 2 — Agency Administrator & Staff
 - 4. Role 3 — The Client (marketplace customer)
 - 5. How a booking moves, end to end
 - 6. Where every setting lives
 - 7. Permissions & feature flags — why your screen may differ from a colleague's
-

1. The big picture

RemSolution runs a car-rental business from end to end, and it does it for many rental businesses at once on the same installation. Three layers, stacked:

The Platform. One control room. It doesn't rent cars — it manages the *agencies* that do: onboarding them, deciding how big they're allowed to get, and switching on which parts of the product each one gets to use.

An Agency. A rental business, with its own fleet, its own branches, its own staff, its own clients, its own money. It is sealed off from every other agency on the platform: an agency literally cannot see another agency's cars, clients or bookings — not by accident, not by URL-guessing, not by a mis-written search. The only account that can see across agencies is the Platform Administrator, and every such look is recorded.

The Marketplace. The public storefront. A visitor searches by place and dates and sees available cars from *every* agency at once, sorted by distance, with photos, prices and agency ratings. They book, the owning agency reviews it, and the booking drops into that agency's normal work queue. The customer never has to know which agency they're dealing with until they've picked a car.

A booking is the object that ties all three together. It starts life as a **reservation** (a hold — the car is blocked, nothing is final) and becomes a **renting** (the actual contract — the car is out with a customer). Everything else in the product exists to feed, price, document or settle those two things.

2. Role 1 — Platform Administrator

The account that exists before any agency does. It carries no agency of its own, which is why it sees no cars and no clients — its two menu items are **Agencies** and **Subscription Plans**, and its home screen is the platform console.

The platform console (home)

A live read on the whole platform: how many agencies, in how many countries, total cars and clients, how many customer accounts have self-registered, and how many countries and pickup places actually have cars on offer (i.e. how much of the marketplace is real inventory rather than empty geography).

Then the commercial picture: active / suspended / expired subscriptions, agencies with **no** subscription at all, subscriptions **expiring soon**, and revenue from active plans. Two numbers to watch in particular:

- **Agencies at car quota** and **agencies at client quota** — businesses that have hit the ceiling of their plan. These are your upgrade conversations, handed to you rather than discovered by accident.

There's also a per-country breakdown (agencies, active subscriptions, cars, clients) and a per-plan breakdown, so you can see where the platform is actually growing.

Onboarding an agency

Agencies → Create. You provide:

- Name, email, phone, address, and country.
- A map pin for the head office (picked on a map, not typed as coordinates).
- **Currency** — the ISO currency the agency trades in (default TND). Every amount that agency ever stores is denominated in it.
- **Cancellation window (hours)** — how close to pickup a client can still cancel without a fee.

- **Reservation expiry (hours)** — how long an unconfirmed hold survives before the system releases the car automatically.
- **Branches** — the agency’s pickup locations, each with a name, address and map pin. You can add them right here during creation rather than as a forgettable follow-up step, because a car has to belong to a branch and an agency with no branch can’t put anything on the marketplace.

The whole thing is created as one atomic operation: if any part of it fails, you don’t end up with a half-built agency holding some of its branches.

Important, as of today: creating an agency does **not** yet create a login for its first administrator. There’s no command in the system that grants anyone the `AgencyAdministrator` role, which means a freshly created agency has nobody who can sign into it. This needs a manual step from the development team until it’s automated — check with them before onboarding a real customer.

Deciding how big an agency may get — Subscription Plans

Subscription Plans → Create. A plan is four numbers and a name:

- **Max cars, max clients, max users** (staff logins).
- **Price** — the plan’s own price, in platform currency.

Assign a plan to an agency and the limits enforce themselves. When an agency at 10/10 cars tries to add an eleventh, the write is rejected — not flagged for review later, blocked at the moment of the attempt, and safely so even if two staff members try simultaneously.

A subscription is **Active**, **Suspended** or **Expired**, managed by you by hand (there’s no billing provider wired in yet). An expired subscription blocks the agency’s writes — they can still read their data, they just can’t transact until it’s renewed.

Deciding which features an agency gets

Separately from size limits, each agency has a set of feature switches. The full list of switchable modules:

`Cars` · `Clients` · `Branches` · `Rentings` · `Reservations` · `Expenses` · `ExtraServices` · `Payments` · `Contracts` · `Factures` (invoices) · `Credits` · `Dashboard` · `Chat` · `Notifications` · `OnlineReservations` · `OnlinePayment`

Switching a module off doesn’t just grey out a button — the API refuses the request outright and the module disappears from that agency’s navigation entirely. An agency that doesn’t pay for Statistics doesn’t see a Statistics menu item teasing them; it isn’t there.

Reference data you maintain for everyone

Under the `⋮` menu you maintain the catalogs that all agencies pick from: **Car Brands**, **Car Models**, plus platform-level **Extra Service Types** and **Expense Types**. Countries are seeded and don’t need maintaining.

Stepping into an agency (support)

When an agency calls with a problem, you can open **that agency’s workspace** and see precisely what its staff see — same navigation, same data, same feature switches, full permissions. A logout-style button in the sidebar (next to the agency’s name, so it’s always obvious whose data is on screen) takes you back out to the platform console. Every entry into an agency’s data is written to an audit trail; this is a documented door, not a hidden one.

3. Role 2 — Agency Administrator & Staff

This is where the rental business actually runs. Two shapes of account:

- **Agency Administrator** — everything the agency has switched on, plus the agency’s own settings and staff management.
- **Agency Staff** — only what they’ve individually been granted. A front-desk hire might handle bookings and clients and never see the money screens; a manager sees all of it.

Because of this, **two colleagues can see genuinely different menus**, and that’s by design rather than a bug. See section 7.

3.1 Today — the landing screen

Not a chart wall. It answers three questions, in the order a desk actually asks them: *what does today ask for*, *what’s waiting on somebody*, and *what’s the fleet doing*? Everything on it comes from a single call, so no two figures on the screen ever disagree with each other, and if a section is missing it’s because that module is off or you lack its permission — never an empty card.

Across the top: - **Bookings today** — hires and live holds starting today, plus how many of those holds still need a yes or no from you. - **Returns today** — hires due back today, and how many of those are due **before midday** (i.e. the morning’s actual workload). - **Late** — hires still out past their due date, and the *worst* one named directly on the card: who, which car, and how many hours late. - **Money** — the agreed price of everything starting today (what you expect to take over the counter), and total outstanding client debt.

Fleet at a glance: total cars, how many are **free** (bookable and not currently out — the number you answer “have you got a car?” with), how many are **on rent**, and how many are **out of service**.

Things waiting on somebody: - **Requests** — holds awaiting your yes/no, with how long the oldest has been waiting, and the top of the queue listed inline so you can confirm or reject without leaving the screen. - **Payables** — expenses booked but not settled, and the total outstanding. - **Expenses due** — recurring car costs coming due, grouped by cost type, each showing its rule (“every 6 months”, “every 10,000 km”) and the specific cars that owe it — with days or kilometres remaining, or how far past due they already are.

If the agency has multiple branches, a picker at the top scopes the whole screen to one of them.

3.2 Cars — the fleet

The list gives you every vehicle with its plate, model, status, rate and photo. Adding or editing a car asks for:

Matricule (plate) · **model** (which implies its brand) · **branch** it’s collected from · **status** · **daily rate** · **first circulation date** · **colour** · **power** · **fuel type** · **current mileage**

Status is the important one: **Active** / **Maintenance** / **Inactive**. Anything other than Active and the car silently drops out of every availability search — no need to remember to hide it, and no risk of double-booking a car that’s in the garage.

Photos. Upload several; mark one as primary (that’s the one the marketplace shows first) and order the rest. Uploads return immediately — the resizing into thumbnail and display sizes happens in the background, so adding eight photos to a car doesn’t leave you waiting on a progress bar. The full-resolution original is always kept.

The list also shows an at-a-glance **availability** — *Available*, *On hire* (with the expected return date), *In maintenance*, *Out of service* — and filters by “in the yard” versus “out on hire”.

There’s also a **quick edit** that opens beside the list rather than navigating away, for the one-field changes (rate, status) that make up most edits.

A car’s own page carries its individual tracking: utilisation rate (days hired out of the period), revenue, its rating and review count, current and upcoming bookings, and its recent expenses.

Where a car’s reference data comes from: Car Brands and Car Models, under the **...** menu. Set those up once; every car afterwards picks from them.

3.3 Bookings — the core of the product

One screen holding both halves of the business, as two tabs over the same list: **hires** (rentings) and **holds** (reservations). They’re together because they’re the same booking at two points in its life — a hold *becomes* a hire — and asking the same questions of them in two differently-shaped screens made the pair harder to read than it needed to be.

Rows are cards rather than table lines, because a booking is read as a whole: who, which car, when, what it’s worth, what’s still owed. Filters, sorting and the active tab all live in the URL, so a filtered view is a link you can bookmark or send to a colleague.

A hold (reservation) moves through: **Pending Confirmation** → **Confirmed** → **Paid** → **Converted**, or leaves the path as **Rejected**, **Expired** or **Cancelled**.

Actions on a hold: - **Confirm** — you accept it. This locks the car and price; it does *not* create the hire. - **Reject** — you’re required to give a reason, and the client sees that reason. Not a silent decline. - **Convert** — turns the confirmed hold into an actual hire, carrying the dates, the snapshot price and any deposit already taken across with it. - **Cancel** — with a reason, checked against the agency’s cancellation window. - Holds nobody answers **expire on their own** after the agency’s reservation-expiry window and release the car. No cleanup job for a human to remember.

A hire (renting) moves through: **Not yet** → **In progress** → **Done**, or **Cancelled**.

Actions on a hire: - **Start** — the car goes out. You log the starting odometer; the field is pre-filled with the car’s current reading, so the common case is one confirmation rather than typing a number. - **Return** — opens a dedicated dialog, reachable from anywhere the hire appears (the bookings list, the car’s own page, the booking panel) rather than making you hunt the booking down. It re-reads the hire fresh on opening, and the pickup odometer becomes the floor the return reading has to clear — you can’t record a return with fewer kilometres than the pickup. The end date is pre-filled with the scheduled one, so leaving it alone means “returned as scheduled” and touches no pricing; changing it re-prices the hire. - **Take payment** — a payment dialog available directly from the booking.

The booking detail panel. Clicking any booking slides a panel in from the side (rather than a box over the middle, which would hide the row you just clicked). It shows: who’s renting, which car and when, a **lifecycle strip** showing where the booking is and what’s behind and ahead of it, the money (price, what’s been paid, what’s outstanding), the extra services attached, the paperwork on record, and only the actions actually legal from the current state.

The panel re-reads the booking from the server on opening, for a specific reason: a row that’s been sitting on a list carries a stale state and a stale concurrency token. If a colleague confirmed that hold two minutes ago, you get told that it moved on — rather than a mysterious failure or, worse, a silent overwrite of their work. This applies throughout: **two people acting on the same booking at once can’t clobber each other**.

Extra services (child seat, GPS, extra driver, whatever the agency defines) attach to a hire and are billed alongside the rental price rather than folded invisibly into it. Their catalog lives under **⋮ → Extra Service Types**.

3.4 Clients

Every customer's file: names, email, birth date/place/country, plus three sets of identity papers, each with its own number, issue date, issue place and issue country:

- **CIN** (national ID card)
- **Passport**
- **Driving licence**

Plus a portrait photo, free-text notes, and a **flag** for clients who've been trouble. That flag is private to your agency — it deliberately does not follow the client to other agencies on the platform.

The client's portrait is extracted automatically from the CIN image. The system locates the holder's photo on the scan of the card and crops a square head-and-shoulders portrait from it. If it can't find one, it falls back to where the photo sits on essentially every ID card — a crop of the right corner of the card being better than no picture at all, and always replaceable by hand. A button re-runs the extraction; if the CIN image hasn't been uploaded yet, the app tells you so rather than failing silently.

Client portal. A client whose email address you hold can be sent an **invitation** to log into their own portal. The create, update and renting paths send this automatically; the manual invite button exists for when the first email got lost, or for a client recorded before the portal existed.

Name searching is accent- and case-insensitive, which matters for a French/Arabic client base: searching *"Ben Ali"* finds *"Bén Ali"*. Deleting a client **archives** rather than erases (their booking and payment history is preserved, and financial records can never be deleted by anyone) — and archiving frees up their CIN so the number can be registered again later if needed.

Chat sits alongside the client list if enabled: a per-booking message thread with the client, so questions about a pickup don't need a phone call.

3.5 Finance — Credits

One screen, both directions of money, as two tabs:

Receivable — what clients owe you. Per-client balances, what's been charged, what's been collected, what's outstanding, with payment history and the ability to record a payment.

Payable — what the agency owes. This absorbed the old standalone expense list, so booking, settling and deleting an expense all happen here. Rows show date, car, expense type, amount, paid, outstanding — and can carry the supplier's invoice as an attached file.

Expenses are tagged with **Expense Types** (⋮ menu), and a type can carry a recurrence rule: *every N months* **or** *every N kilometres* — one or the other, not both. Types marked for notification feed the "expenses due" card on the Today screen and can trigger notifications, which is how servicing, insurance renewal and technical inspection stop depending on someone's memory.

Both a summary bar and the tab filters live in the URL, so "this car's expenses" is a shareable link that lands on the right tab with the filter already applied.

3.6 Statistics

Behind the Dashboard entitlement, alongside the overview. Revenue charged versus collected over a period, expenses over the same period, the resulting net, outstanding on both sides, a time series you can chart, and the rankings — best-performing cars, most valuable clients, fleet utilisation.

3.7 Contracts & Invoices — Document Templates

⋮ → Document Templates. This is one of the better parts of the product and worth understanding properly.

You build a template out of **blocks** (a document editor, not a file upload), for one of two kinds: **Contract** or **Facture** (invoice). The block palette is deliberately small and closed, because a rental contract is structurally always the same thing:

- **Heading** — large bold line: the document's title or a section heading.
- **Paragraph** — a run of text: the clauses of a contract.
- **Fields** — a boxed label/value grid: "Lessor", "Vehicle", "Rental period". Two Fields blocks set side by side are drawn as one row of two boxes (lessor next to renter).
- **Line items** — the invoice's billed-lines table. Its rows come from the booking (rental charge + extra services) rather than from the template, so the block only carries the column headings and the totals switch.
- **Signatures** — one ruled line per label, for wet signatures.
- **Page break** and **Spacer**.

Anywhere in the text you write a placeholder, and the editor collects every distinct placeholder it finds into a binding list. For each one you choose how it gets filled:

- **Data field** — pulled from the booking automatically at generation time. If the placeholder name is itself a known path, it binds itself with no work from you. The available paths cover:
 - *Agency*: name, address, email, phone
 - *Client*: first/last/full name, birth date, birth place, CIN + its issue date and place, passport number, driving licence number + issue date, notes
 - *Car*: plate, model, colour, power, fuel type
 - *Renting*: start date, end date, days, price, deposit, start mileage, notes
 - *Invoice*: rental amount, extra services amount, total, amount paid, balance due
 - *Document*: number, issue date, currency
- **Fixed value** — the same text on every document (a franchise amount, a standing clause). Stored once on the template.
- **Ask each time** — the agent is prompted for it at generation. The escape hatch for clauses that genuinely vary per rental and live in no database column.
- **Blank** — left as a ruled line to complete by hand on the printed copy.

The editor greys out placeholders that are no longer used by any block, so a template stays honest as you edit it. Generated documents are **numbered and append-only**: regenerating a contract issues a new numbered document rather than quietly replacing the previous one — which is the behaviour you want the day a customer disputes which version they signed.

The **list** of templates and the **editor** are deliberately separate screens.

3.8 Notifications

Two audiences, deliberately separated.

Your own work queue (in-app, optionally emailed to staff):

- **Car expense due** — a recurring cost (maintenance, insurance, technical inspection, road tax) is due or overdue on a car, by date or by odometer.
- **Renting overdue** — a hire is past its end date and the car hasn't come back.
- **Reservation upcoming** — a confirmed hold starts within your configured lead time.

Messages to the client (email, plus a record that it was sent):

- **Booking starting soon** — a few days before pickup.
- **Rental ending soon** — a few days before the return is due.
- **Late return notice** — only ever sent **by hand**, from the client list or detail screen. Nothing sends this on a schedule, because whether a late return deserves a letter is a judgement call the agency should make, not a cron job.

All the lead times and email toggles are in **My Agency** (below).

3.9 Team — staff and their permissions

An administrator adds staff here, sets each one active or inactive, and grants permissions module by module. The grant UI only offers permissions belonging to modules the agency actually has enabled — you can't grant somebody a permission for a feature you don't have.

Permissions are per-module CRUD: create / read / update / delete for Cars, Clients, Branches, Rentings, Reservations, Expenses, Extra Services, Payments; plus read/generate for Contracts and Invoices, read for Credits, view for Dashboard, view/send for Chat, and send for client Notifications.

Revoking a permission takes effect within one short token lifetime — not at next login, and not requiring you to hunt down the user and force them out.

3.10 My Agency — the agency's own settings

Account menu (top right) → **My Agency**. Administrator-only. This is the agency's control panel:

- **Identity**: name, email, phone, address, country.
- **Cancellation window (hours)** — how late a client may cancel free of charge.
- **Reservation expiry (hours)** — how long an unanswered hold survives.
- **Expense due lead days** and **lead kilometres** — how much warning you want before a recurring car cost comes due, on each clock.
- **Reservation upcoming lead days** — how far ahead a confirmed hold should announce itself.
- **Notify staff by email** / **notify clients by email** — the two master email switches.
- **Client reminder days before start** / **before end** — when the customer's own two reminders go out.

Branches are managed as a sub-section: add, edit or remove pickup locations, each with a name, address and map pin.

4. Role 3 — The Client (marketplace customer)

The public side. No agency relationship needed to start, and no agency is chosen up front — the customer picks a *car*, and the agency comes with it.

Signing up

Email and phone, email verification, and acceptance of terms and privacy policy — that last one is captured with a timestamp, because the account is about to be asked for a passport.

Browse Cars

Pick a **country**, optionally a specific **pickup place**, and your **dates**. The place picker only lists countries and places that actually have cars available, so there are no dead ends to click into.

Results come as a **list or a map**, and the two always describe the same set of cars. On the map you can **“search this area”** to narrow to the current viewport; hovering a result in the list lights up its pin. Changing any filter clears a viewport restriction, so a map position you’ve forgotten about can’t keep silently narrowing your results.

Each result shows the car, its daily rate, its primary photo, the agency, the pickup place, the distance, and the agency’s average rating. There are dedicated pages for a single **car** and a single **agency** (its fleet and its reviews).

Booking

Pick a car, confirm the dates, and give the driver details (name, birth date) plus identity documents. Behind the scenes this creates or reuses your client file *at that specific agency* — the system matches you against an existing record rather than blindly creating a duplicate, so a returning customer stays one person in that agency’s books.

The booking lands as a **Pending Confirmation** hold: the car is genuinely blocked for you while the agency reviews it. Double-tapping the button or retrying on a flaky phone connection returns the same booking rather than creating a second one.

My Reservations

Track each hold: **Pending Confirmation**, **Confirmed**, **Paid**, **Converted**, or **Rejected** (with the agency’s stated reason), **Expired** (nobody answered in time), **Cancelled**. You can cancel a hold yourself; whether it costs you anything depends on the agency’s cancellation window, which is visible before you book.

My Rentings

Your trips, across every agency, before / during / after. This is also the only place a **rating** starts from — you rate a rental you actually took, not an agency you merely browsed. One rating per completed rental: stars plus a comment, on the car and/or the agency. Those averages are what feed the ratings other customers see in search results.

My Chats

Message threads with agencies about specific bookings. Not gated on anything from your side: an agency without the Chat module simply never opens one, so the list stays empty rather than showing you a broken feature.

5. How a booking moves, end to end

Following one car through one full cycle, and naming who does what:

1. **Platform Admin** onboards *Sfax Auto*, assigns it the Pro plan (200 cars, 10 staff), switches on Reservations, Payments, Contracts, Credits, Chat and Notifications.
2. **Agency Admin** at Sfax Auto adds two branches (Sfax Centre, Sfax Airport), then adds a Clio: plate, model, Sfax Airport, 90 TND/day, **Active**, six photos.
3. **A customer** in Lyon searches “Tunisia, 12–15 August”, sees the Clio 4 km from the airport at 90 TND/day with the agency at 4.6 stars, and books it. Her passport and licence upload once and are remembered.
4. **The hold** appears within seconds on Sfax Auto’s **Today** screen under *Requests*, with a countdown — it will expire in 48 hours if nobody answers.
5. **Agency staff** confirms it inline from the Today card. The car is now locked for those dates and the price is fixed at 270 TND; the customer sees **Confirmed** under My Reservations and gets a reminder email two days before pickup.
6. **At the counter, 12 August:** staff opens the booking, takes the payment, converts the hold into a hire, and hits **Start** — the odometer field is pre-filled at 48,200 km, they confirm it, the car goes out. A contract is generated from the agency’s own template, numbered, with the client’s name, CIN, plate and dates already filled in.
7. **During the rental** the customer adds a day of GPS via chat; staff attaches the extra service to the hire.
8. **15 August:** the car comes back. Staff opens **Return** from the cars list, logs 48,940 km (the dialog won’t accept anything below 48,200), leaves the date as scheduled, and completes the hire. Final price settles including the GPS; an invoice is generated and numbered.

- 9. **Money:** the Credits screen shows the client’s balance clearing. The Statistics screen counts the 270 TND plus extras toward the month.
- 10. **After:** the customer rates the Clio and Sfax Auto five stars from My Rentings, which nudges the agency’s average and shows up in the next customer’s search results.
- 11. **Meanwhile:** the Clio has crossed 50,000 km since its last service, so it appears on Sfax Auto’s Today screen under *Expenses due* — and, if that expense type is set to notify, in the agency’s notification list too.

Nobody in that story opened a spreadsheet.

6. Where every setting lives

There is deliberately no single “Settings” page. Configuration sits next to whatever it configures:

What	Where	Who
Agencies, their currency, cancellation/expiry defaults, branches	Agencies	Platform Admin
Car / client / user limits, plan pricing	Subscription Plans	Platform Admin
Which modules an agency may use	Agency’s feature switches	Platform Admin
Car Brands, Car Models	⋮ menu	Platform Admin (globally) / Agency Admin
Expense Types (incl. recurrence rules)	⋮ menu	Agency Admin
Extra Service Types	⋮ menu	Agency Admin
Document Templates (contracts, invoices)	⋮ menu	Agency Admin
Agency identity, cancellation window, reservation expiry, notification lead times, email toggles, client reminder timing	Account menu → My Agency	Agency Admin
Branches (pickup locations)	My Agency → branches	Agency Admin
Staff accounts and their permissions	Team	Agency Admin
Your own name, language, password	Account menu → Profile	Everyone

The application runs in **French and English**, switchable per user. Data the agency itself typed (brand names, service types) is never machine-translated — those are proper nouns and the agency’s own words.

7. Why your screen may differ from a colleague’s

Two independent gates decide what you see, and both have to open:

- 1. Is the module switched on for your agency?** Decided by the Platform Administrator per agency. If Expenses is off, nobody at your agency has an Expenses screen — not the administrator, not anyone.
- 2. Do you personally have the permission?** Decided by your agency administrator, per user, per module. If you lack `Expense.Read`, you have no Expenses screen even though your colleague does.

A permission for a switched-off module counts for nothing — the feature gate is checked first, and a disabled module answers “forbidden” rather than explaining what it would have wanted from you.

The navigation reflects this honestly rather than teasing: a group with nothing in it disappears entirely, and a group with only one reachable screen collapses into a plain link, so you never expand a menu to find a single item. Same rule on the Today screen — a section you can’t see is simply absent, not rendered as an empty card or a zero that was never counted.

So if something described in this document isn’t in your menu, the answer is almost always one of those two gates. Your agency administrator can check both.
